

Lens & Learn

| *Point your phone at anything — and learn the words for what you see.*

What is it?

Lens & Learn is a language-learning app that turns your camera into a vocabulary teacher.

Snap a photo of any scene — a room, a street, a café — and the app instantly labels everything it sees in your target language. You hear how each word sounds, see an example sentence, and save the words you want to keep.

Then, with one tap, your saved words get **woven into a single sentence** — and an AI illustration of that sentence appears in front of you.

Your vocabulary, turned into a picture you won't forget.

The Three Steps

1. **Snap** — Take or pick a photo. The app identifies the objects and labels them in Mandarin (with pinyin and pronunciation).
 2. **Save** — Tap any words you want to keep. They go into your Word Bank.
 3. **Forge** — Hit one button. Your words combine into a natural sentence, and an AI-generated illustration brings that sentence to life.
-

Why it works

Traditional flashcards give you a word. We give you a **word + a visual story**.

This is based on *dual coding* — a well-established learning science principle: when you pair verbal information with a visual image, you remember it significantly better than with text alone.

You're not memorizing a list. You're watching your vocabulary become a scene.

Built with the latest AI

Lens & Learn was built in ~4 hours using the newest tools announced at **Google I/O 2026**:

- **Gemini 3.5 Flash** — identifies objects in photos and generates the combined sentence
- **Nano Banana 2 (image generation)** — creates the illustration from the sentence
- **On-device Text-to-Speech** — lets you hear every word pronounced correctly

Every AI-generated image carries an invisible **SynthID watermark** — a provenance marker that proves the image was AI-generated. Responsible AI, built in from day one.

Demo (75 seconds)

1. Open the app and pick a photo of a room.
2. Vocab cards appear — tap a word to hear it spoken aloud.
3. Save 3–4 words to the Word Bank.
4. Tap **Forge** — a sentence assembles, and an illustration blooms on screen.

"Your vocabulary, combined into a sentence you can see."

Works for any language

The demo runs in Mandarin with pinyin, but the pipeline is language-agnostic. Spanish, Japanese, French — one config change, same experience.
